

Project Documentation

CTU College Website – Courses & Services

This Document outlines the planning, design, and development of the college website.

Project Overview

The aim of this project is to design and develop a modern, responsive, and user-friendly college website to showcase courses, services, and important information for students.

Technologies and Tools Used

HTML5 – Website structure and content

HTML5 was used to create the structure and content of the website. It provides the foundation for all pages, including headings, navigation menus, images, forms, and course information. Semantic HTML elements were used where appropriate to improve accessibility and maintainability.

CSS3 – Styling and responsive design

CSS3 was used to style the website and create a modern, responsive user interface. It was responsible for the layout, typography, colours, spacing, and visual consistency across all pages.

Git – Version Control

Git was used as the version control system for the project. It allowed team members to track changes, maintain a history of modifications, and collaborate efficiently without overwriting each other's work.

GitHub – Repository hosting and collaboration

GitHub was used to host the project's Git repository and facilitate team collaboration. It provided a centralized location for source code management, branch handling, code reviews, and project tracking. GitHub also served as a backup of the project throughout development.

Design Explanation

The website uses a black and white colour palette with a touch blue. This colour scheme Creates a professional, modern, and clean appearance.

The navigation and user experience approach were designed so that users could immediately see the most important sections first and quickly move between them to access information easily.

One of the main reasons also for this choice in style is due to time constraints, while still needing a professional looking website.

Overall this design focuses on:

- Simplicity
- Professional Appearance
- Easy Navigation
- Clear service presentation
- Responsive user experience

Team & Contributions

Name	Responsibilities
Alman Deang	Created the project folder structure, integrated team code, prepared project documentation, and established the overall website design.
Zinhle Mhlambi	Designed and implemented the navigation bar, responsive mobile menu, and website animations.
Bongile Kumalo	Designed and developed the Services section, including service descriptions and layout.
Omogolo Meje	Designed and developed the Footer section, including quick navigation links and contact information.
Jodine Lemena	Designed and developed the About Us section, including the company vision, descriptions, and accreditations
Paballo Mitileni	Designed and developed the Hero section, including call-to-action buttons and introductory content.

Testing

- Cross-browser testing (Chrome, Edge, Brave)
- Responsive testing on mobile, tablet, and desktop
